# Outline

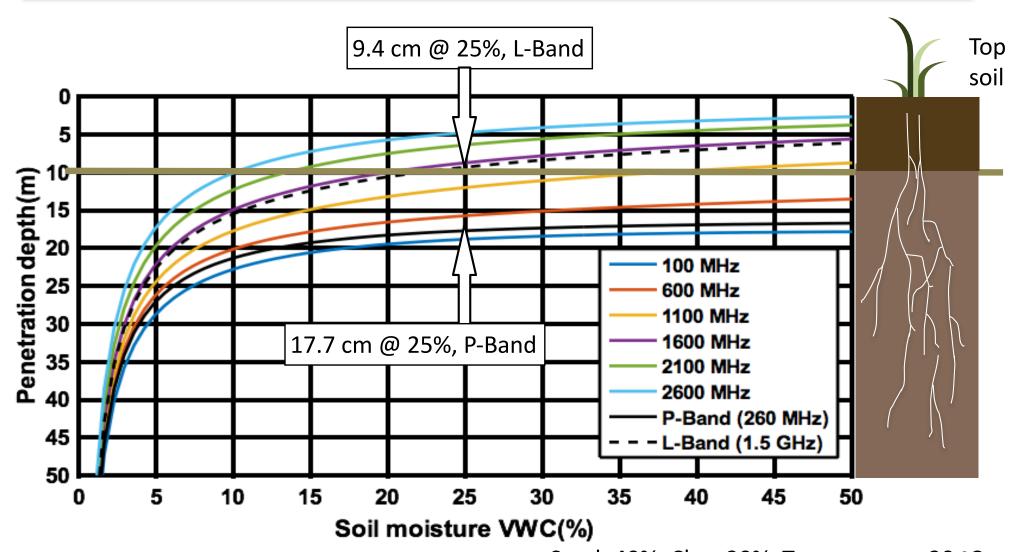

- P-band, Soil Moisture, and SoOp
- SoOp-AD and Results
- RFI Effects in SoOp
- Spectrum Observations
- Conclusions

# Importance of Sensing < 500 MHz

Sand: 40%, Clay: 20%, Temperature: 20 °C

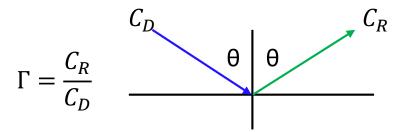

# Soil P-band Reflectivity

#### **Assumption:**

- 1. Flat specular reflection
- 2. Single layer and media
- 3. No vegetation effect

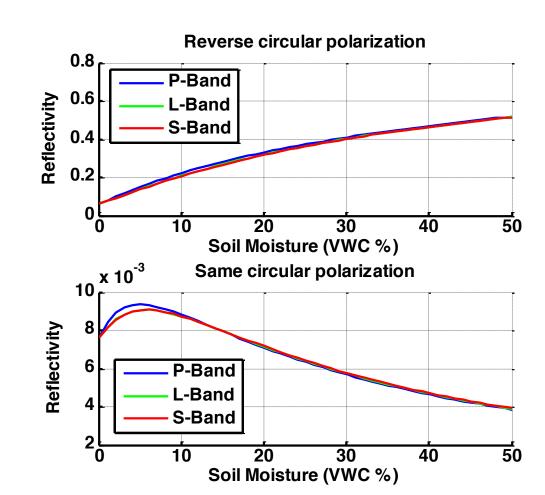

#### Specular reflection

Γ: Reflectivity

 $C_D$ : Carrier power for direct signal

 $C_R$ : Carrier power for reflected signal

# P-band Signals of Opportunity (SoOp)

- Re-utilization of existing transmissions (e.g. potential RFI sources)
- No transmit permission required (re: ESA's Biomass)
- Bands allocated for Space-Earth communications
- High power, forward scatter -> High SNR/smaller antenna
- Resolution set by signal bandwidth or Fresnel zone

P-band SoOp offers opportunity to measure deeper soil moisture from space at low cost

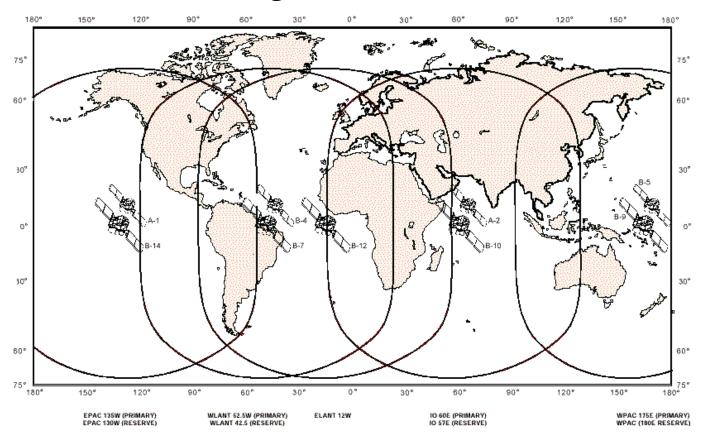

July IGARSS 2017 5

- 225–420 MHz allocation for defense/government use
- Continuous use by US & Others since 1978 (FLTSATCOM)
- Planned utilization through 2024

- Multiple Low bandwidth (5, 25 KHz) digital channels.
- Well documented and (supposedly) easy to receive by:

#### **Pirates**

"Nearly illiterate men rigged a radio in less than one minute" [Wired, April 20, 2009]

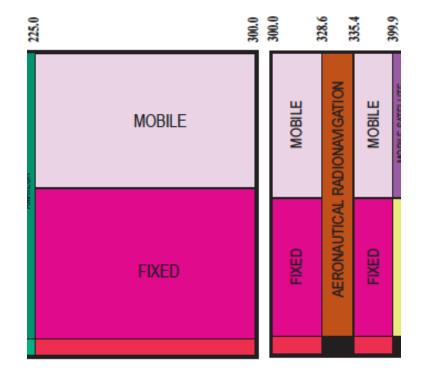

# P-Band Allocation

#### Wide government use:

"The band 225-328.6 MHz is used for a diverse array of land-based, airborne, maritime, and satellite radio communications services by the military forces, National Guard units, Federal Aviation Administration (FAA), Coast Guard (CG), National Aeronautics and Space Administration (NASA), Department of Energy (DOE), and other Federal agencies. Tactical and non-tactical mobile communications, mobile-satellite communications, and air traffic control communications are the most prevalent uses."

# **Estimating Reflectivity**

#### Auto-correlation of channel 1

$$R_{11}(\tau) = \langle x_1^*(t) x_1(t+\tau) \rangle$$

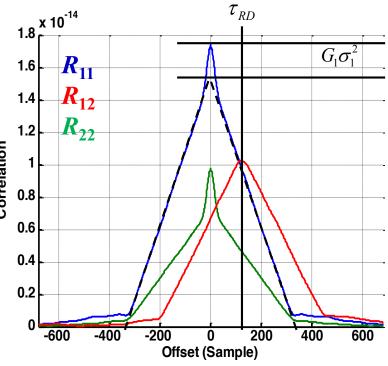

$$= G_1 G_{S,D} C_D \langle a^*(t-\tau_D) a(t-\tau_D+\tau) \rangle + G_1 \sigma_1^2 \delta(\tau)$$

#### Cross-correlation of channel 1 and 2

$$\begin{split} R_{12}\left(\tau\right) &= \left\langle x_{1}^{*}\left(t\right)x_{2}\left(t+\tau\right)\right\rangle \\ &= \sqrt{G_{1}G_{2}G_{S,D}G_{E,R}\Gamma}C_{D}\left\langle a^{*}\left(t-\tau_{D}\right)a\left(t-\tau_{R}+\tau\right)\right\rangle e^{j\omega\left(\tau_{R}-\tau_{D}\right)} \overset{\text{posterior}}{=} & \\ \mathbf{F}_{12}\left(\tau\right) &= \left\langle G_{1}G_{2}G_{S,D}G_{E,R}\Gamma\right\rangle \left\langle a^{*}\left(t-\tau_{D}\right)a\left(t-\tau_{R}+\tau\right)\right\rangle e^{j\omega\left(\tau_{R}-\tau_{D}\right)} \overset{\text{posterior}}{=} & \\ \mathbf{F}_{12}\left(\tau\right) &= \left\langle x_{1}^{*}\left(t\right)x_{2}\left(t+\tau\right)\right\rangle \left\langle a^{*}\left(t-\tau_{D}\right)a\left(t-\tau_{R}+\tau\right)\right\rangle e^{j\omega\left(\tau_{R}-\tau_{D}\right)} \overset{\text{posterior}}{=} & \\ \mathbf{F}_{13}\left(\tau\right) &= \left\langle x_{1}^{*}\left(t\right)x_{2}\left(t+\tau\right)\right\rangle \left\langle a^{*}\left(t-\tau_{D}\right)a\left(t-\tau_{R}+\tau\right)\right\rangle e^{j\omega\left(\tau_{R}-\tau_{D}\right)} \overset{\text{posterior}}{=} & \\ \mathbf{F}_{13}\left(\tau\right) &= \left\langle x_{1}^{*}\left(t\right)x_{2}\left(t+\tau\right)\right\rangle \left\langle a^{*}\left(t-\tau_{D}\right)a\left(t-\tau_{R}+\tau\right)\right\rangle e^{j\omega\left(\tau_{R}-\tau_{D}\right)} \overset{\text{posterior}}{=} & \\ \mathbf{F}_{13}\left(\tau\right) &= \left\langle x_{1}^{*}\left(t-\tau_{D}\right)a\left(t-\tau_{R}+\tau\right)\right\rangle e^{j\omega\left(\tau_{R}-\tau_{D}\right)} \overset{\text{posterior}}{=} & \\ \mathbf{F}_{13}\left(\tau\right) &= \left\langle x_{1}^{*}\left(t-\tau_{D}\right)a\left(t-$$

#### Reflectivity:

$$\frac{R_{12}(\tau_{RD})}{R_{11}(0) - G_1 \sigma_1^2} = \sqrt{\frac{G_2 G_{E,R}}{G_1 G_{S,D}}} \sqrt{\Gamma e^{j\omega \cdot \tau_{RD}}}$$

Reflectivity: 0.65, EIRP: 26 dB

# **RFI Impacts Estimate**

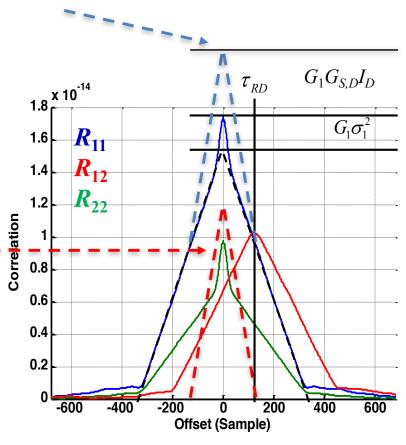

• RFI in sky antenna (channel 1) adds to  $R_{11}(0)$ , which attenuates estimate by:

$$\sim \left(\frac{1}{1 + ISR}\right)^2 \qquad ISR = \frac{I_D}{C_D}$$

- RFI in Earth antenna increases noise
- RFI in both antennas adds to R<sub>12</sub>
  - Systematic addition or subtraction, else
  - Increase noise if  $\tau_{RD} \gg 1/BW_I$

#### Reflectivity:

$$\frac{R_{12}(\tau_{RD})}{R_{11}(0) - G_1 \sigma_1^2} = \sqrt{\frac{G_2 G_{E,R}}{G_1 G_{S,D}}} \sqrt{\Gamma} e^{j\omega \cdot \tau_{RD}}$$

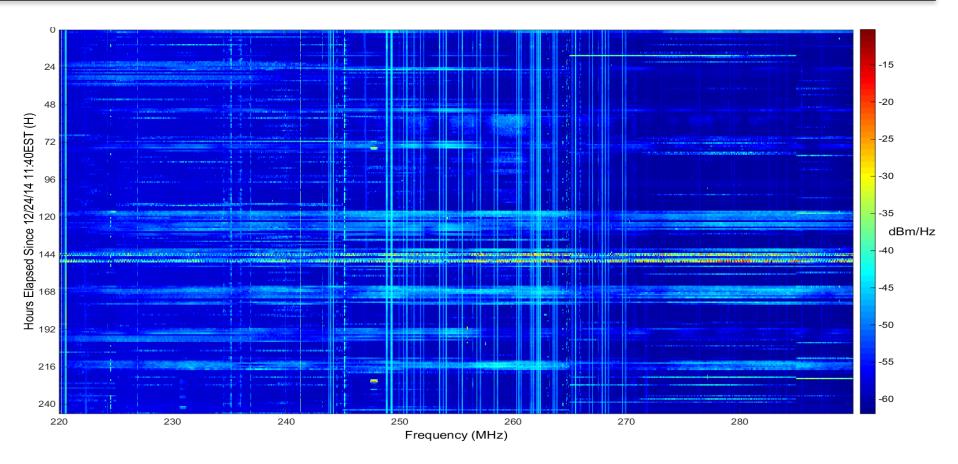

Reflectivity: 0.65, EIRP: 26 dB

# **Urban Local Spectrogram**

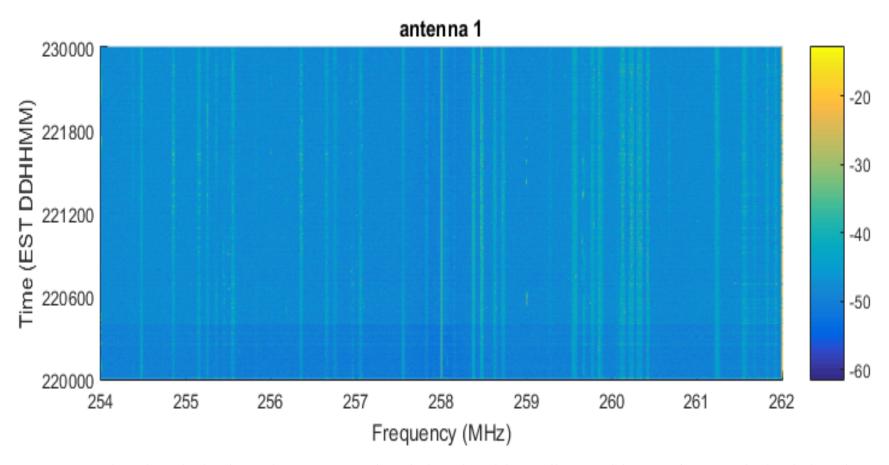

Spectrogram collected near Washington, D.C. shows desired persistent narrowband signals but with significant broadband transient interference.

# Rural Local Spectrum 1

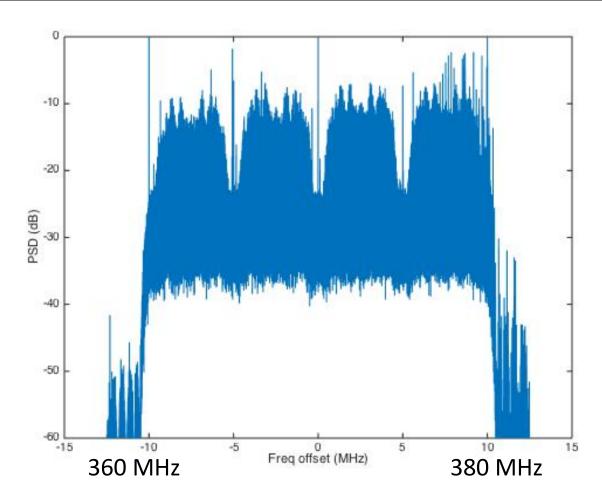

Spectrogram showing desired persistent narrowband signals with no discernable RFI from undesired signals.

# Rural Local Spectrum 2

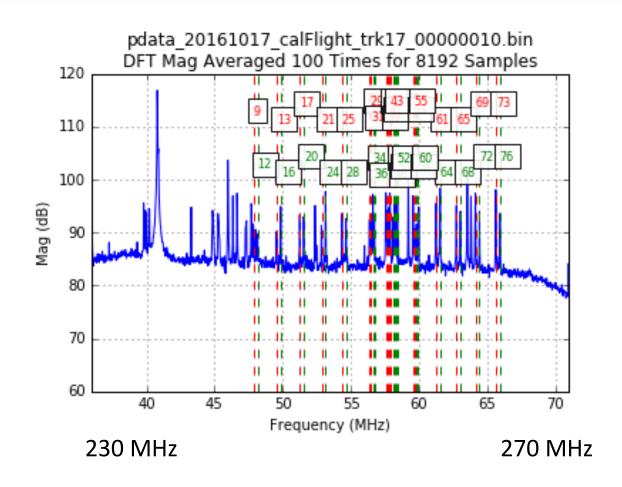

Spectrogram showing desired persistent narrowband signals with potential RFI in band 4.

# Airborne Spectrum

Spectrogram showing desired narrowband signals with no discernable RFI from undesired signals.

- This work was funded under NASA Grant NNX14AE80G (2013 Instrument Incubator Program).
- USDA (Michael Cosh) provided valuable assistance with utilizing the Little Washita ARS Micronet data.

### Discussion

- Rural spectrum cleaner than Urban spectrum
- Urban spectrum possibly worst case because
   D.C. area
- Airborne spectrum example appears clean
